SYSTEM ARCHITECTURE

AI Tool Comparison Guide

Poweredby Cursor Agent · Tavily Search · LLM-as-Judge

User Input
AI tools to compare, criteria, use-case, budget

Streamlit UI
Web interface — input form for comparison parameters

Agent Brain — Cursor
AI coding agent that orchestrates tool research & logic

Comparison Engine
Structures data — features, pricing, pros/cons per tool

LLM-as-Judge
Scores comparison quality & checks for bias/accuracy

Output Display
Side-by-side comparison table + quality score

Deployed on Railway / Vercel
Live on the internet — accessible anywhere

ROLE A OWNS

UI + API setup
+ Tavily connect

ROLE B OWNS

Cursor Agent
+ Judge logic
+ UI + Deploy

THE FLOW — TOP TO BOTTOM

01 **User Input**
User enters the AI tools to compare, evaluation criteria, use-case, and budget constraints.

02 **Streamlit UI**
The webpage that collects input via an interactive form and passes it downstream.

03 **Agent Brain — Cursor**
Cursor AI agent thinks and decides which tools to research and what comparisons to make.

04 **Tavily Search**
Agent queries Tavily to fetch real, up-to-date data about each AI tool from the internet.

05 **Comparison Engine**
Combines search results + Cursor reasoning to build a structured feature-by-feature comparison.

06 **LLM-as-Judge**
A second AI call reviews the comparison for bias, completeness, and accuracy — assigns a quality score.

07 **Output Display**
Shows the final side-by-side comparison guide + quality score to the user.

08 **Railway / Vercel**
The entire app is deployed live on the internet via Railway or Vercel.
